

10	ERH26_PS_10	Crime OS AI – Agentic AI Platform for Intelligence-led Investigations	Legal Intelligence & Automation
----	-------------	---	---------------------------------

Background

Investigators handle both cyber and conventional crime with limited time and heavy documentation burdens. An agentic AI platform can assist across the investigation lifecycle — ingesting complaints, suggesting investigation paths, automating legal requests to service providers, analyzing responses, and maintaining case summaries — enhancing investigative speed, efficiency, and scale.

Problem Statement

Develop Crime OS AI, an agentic AI platform for intelligence-led investigations that assists police with both cyber and conventional crime. The platform leverages AI, automation, and multi-source intelligence across the lifecycle: multimodal complaint ingestion, AI-suggested investigation paths grounded in SOPs, automated generation and dispatch of legal requests to service providers, analytics over the responses received, and auto-generated case logs and summaries.

Key Objectives

- Ingest and process complaints from multiple formats and languages.
- Provide AI-suggested investigation paths grounded in standard operating procedures.
- Automate legal-request generation and dispatch to service providers.
- Analyse provider responses and auto-generate case logs and summaries.

Functional Requirements

- I. Multimodal Complaint Ingestion
 - a. Ingest and process complaints from PDFs, audio recordings, and images.
 - b. Multilingual support: Gujarati, Hindi, and English.
 - c. Structured extraction of entities, sections, and key facts.
- II. AI-Powered Investigation Paths
 - a. Suggest potential investigation paths based on provided SOPs.
 - b. Optional step-by-step guidance for the officer.
 - c. Recommend relevant legal sections (BNS/BNSS/BSA) and case laws.
- III. Automated Workflows
 - a. Auto-generate legal requests and dispatch to telecom operators, banks, and platforms via email automation.
 - b. Use LERS/compliant request templates where applicable.
 - c. Track request status and responses.
- IV. Response Analytics & Case Summaries
 - a. Download and analyse data returned by service providers (subject to technical/regulatory feasibility).
 - b. Auto-generate case logs and summaries from investigation activity.
 - c. Search, version history, and audit trail.

Evaluation Criteria

- Accuracy of multimodal/multilingual ingestion.
- Usefulness of AI investigation-path and legal-section suggestions.
- Reliability of automated request generation and dispatch.
- Quality of response analytics and auto-summaries.
- Usability for non-technical officers and integration readiness.

Suggested Tools / Technologies

- LLMs (with RAG over SOPs/legal datasets), spaCy, BERT
- Whisper-style ASR (audio), Tesseract / Vision OCR (images)
- Node.js / Django / Flask, email automation
- PostgreSQL / MongoDB, React.js

Bonus Points

- Role-based access (IO, SHO, Legal Advisor).
- Integration with CCTNS / eGujcop mock APIs.
- Evidence image upload and tagging.
- Offline-first support for low-network stations.

Deliverables

- Working prototype demonstrating ingestion, path suggestions, and automated requests.
- Demo: complaint → investigation path → generated request → case summary.
- Documentation (architecture, SOP grounding, automation logic).
- Sample (anonymized) datasets used.
